

## Deploy to package cloud using circle ci

Copy the setting.xml file into .circleci folder. It has package cloud configuration. To accept incoming requests from package cloud wagon extension we need api keys.

Change the last step in config.yml from

Run: mvn integration-test

To run: mvn deploy

But we have to mention the path of settings.xml file

Mvn deploy -s .circleci/settings.xml

We do not want to push api key to GitHub. We can create environment variable (PCLOUD) in circleci and refer to it in setting.xml as `${env.PCLOUD}`
