

JUnit 4 to JUnit 5 migration

We do not have to specify junit 4 dependency as spring-boot-starter-test brings that for us.

JUnit 4 will run under JUnit Vintage section and JUnit 5 will run under JUnit Jupiter section.

We can see under results terminal....

To remove unused imports go to java and right click and select optimize imports.

To exclude junit 4:

```
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-test</artifactId>
    <scope>test</scope>
<exclusions>
<exclusion>
    <groupId>junit</groupId>
    <artifactId>junit</artifactId>
</exclusion>
</exclusions>
</dependency>
```

We can see the dependency tree that junit 4 dependency would have been removed...
