

Returning values from Mockito mocks

```
@Test
void findByIdTest(){
    Speciality speciality = new Speciality(); // object to return from mock
    when(specialtyRepository.findById(1L)).thenReturn(Optional.of(speciality));
    // specifying if we call findById for id 1L then return optional of speciality
    object that we created above
    Speciality foundspeciality = service.findById(1L);
    // then we are making actual to method under class that is being tested.
    assertThat(foundspeciality).isNotNull();
    //assuring that we get the speciality object back
    verify(specialtyRepository).findById(1L);
}
```
