

TDD

Book by Kent Beck (who also developed junit).

Write your test along with code.... If something is working fine then you add that code.

We have to override equals method for custom classes (by default it looks for same memory location)

Using test coverage we can see how much of the code lines have been covered through test.

It will give detail info for every class.

We can also see from sides of method... if it is green means covered else if it is blue then not covered..

We can also see under project section about lines covered in the package or classes.

Analyse -> inspect code

We can see stuff for bad coding conventions.
