

## Installing Jars form command line

Using oracle jars, we have sign the license agreement as they do not provide on central repo freely.

To install an external file we can download that library into local repo using maven

```
mvn install:install-file -Dfile="./ojdbc11.jar" -DgroupId=com.oracle  
-DartifactId=ojdbc11 -Dversion=11.0 -Dpackaging=jar
```

In -Dfile we have to provide its location.

Now we can include that by giving the location from repository folder to its location inside .m2 in groupId

And then name in artifactID and version you installed.

We are using install-file as goal.
