

Getting Started With Maven

pom.xml -> contains Maven builds. It drives the maven project.
artifactId, groupId -> coordinates.

Mvn clean -> cleans up the environment.
It removes the target file.

Mvn package -> checks for any sources to compile
It generates a folder target where we could find generated classes.

Mvn clean package -> clean the environment and recompile the package.

groupId -> reverse of domain.

mvn package: Creates JAR or WAR file for the project to convert it into a distributable format. mvn install: Deploys the packaged JAR/ WAR file to the local repository. mvn site: generate the project documentation.

- **mvn clean:** Cleans the project and removes all files generated by the previous build.
