

Next()

To end reading input from the console when using Scanner's `next()` method, you need to provide an input termination signal.

One common approach is to use a specific input that signals the end of input. For example, you can use a special word like "exit" or a specific character sequence like "Ctrl+D" (on Unix-like systems) or "Ctrl+Z" (on Windows) to indicate the end of input. The exact mechanism depends on the environment you're working in.
