

Create Nexus build profile

We have to remove default active from package cloud as which will be active will be decided by os.

Package cloud does not have feature to set up itself as proxy for other repository.

Updated pom:

```
<build>
  <extensions>
    <extension>
      <groupId>io.packagecloud.maven.wagon</groupId>
      <artifactId>maven-packagecloud-wagon</artifactId>
      <version>0.0.6</version>
    </extension>
  </extensions>
</build>

<profiles>
  <profile>
    <id>packagecloud</id>
    <distributionManagement>
      <repository>
        <id>packagecloud.release</id>
        <url>packagecloud+https://packagecloud.io/springframeworkguru/
release</url>
      </repository>
      <snapshotRepository>
        <id>packagecloud.snapshot</id>
        <url>packagecloud+https://packagecloud.io/springframeworkguru/
snapshot</url>
      </snapshotRepository>
    </distributionManagement>
  </profile>
  <profile>
    <id>nexus_distro</id>
    <distributionManagement>
      <snapshotRepository>
        <id>nexus-snapshot</id>
        <url>http://localhost:8081/repository/nexus-snapshot</url>
      </snapshotRepository>
      <repository>
        <id>nexus-release</id>
        <url>http://localhost:8081/repository/nexus-release</url>
      </repository>
    </distributionManagement>
  </profile>
</profiles>
```

```
    </distributionManagement>
  </profile>
</profiles>
```

Remember we have proxy for nexus by setting up mirror (that will mirror our local repositories as repository managers as well as nexus) so we do need to write repositories element.

If both profiles are selected one will be selected as random.

If you want to also bring repo from package cloud as well as nexus you can set up maven proxy recipe for package cloud and include it in group.
