Common Maven Repo

JBOSS -> have large open source base.

```
<dependencies>
   <dependency>
      <groupId>org.jboss.ejb3</groupId>
      <artifactId>jboss-ejb3-api</artifactId>
      <version>3.1.0</version>
   </dependency>
</dependencies>
```

Raising issue of could not find in central, now we can add its real location.

```
<repositories>
   <repository>
      <id>redhat-ga</id>
      <url>https://maven.repository.redhat.com/ga/</url>
   </repository>
</repositories>
```

Ga-> general availability.

Effective pom changes:

```
<repositories>
  <repository>
    <id>redhat-ga</id>
    <url>https://maven.repository.redhat.com/ga/</url>
  </repository>
  <repository>
    <snapshots>
      <enabled>false</enabled>
    </snapshots>
    <id>central</id>
    <name>Central Repository</name>
    <url>https://repo.maven.apache.org/maven2</url>
  </repository>
</repositories>
```

Settings elements:
<servers> contain authentication details (like password, username, etc..)
needed to connect to other server for drawing things from repo or distributing
our own repo.
