Code coverage with Jacoco

It generates a report of the test coverage.
Imp. Build artifact to build the history of the test coverage.
In the executions section of plugin we have to setup failsafe and surefire plugin and set their directories for output.

Argline is the section we have to add as surefire passes arguments for testing.

We are putting the executors...(jacoco-ut.exec, jacoco-it.exec) to hook into the runtime to gather the coverage data.

Get the output in site folder inside target folder.
