Maven in Real World

You can see from this, I test the name ends with Spec (As that is a naming convention I use for all my Spock Specification classes) and if it does output one template, otherwise it will output a different template.

Child module can inherit only plugins, configuration, propertes, dependencies and not other resources…

Plugin repositories specifies the plugins needed from some external repo.

We can also redirect the output of a command to a file
Mvn dependency:tree > jt.temp

Any changes made to parent pom will reflect in its child modules….
